

Word for Word

Simple or simplistic?

Although both *simple* and *simplistic* refer to something that is plain or free of complexity, the words have different connotations beyond their definitions.

Something that is *simple* is straightforward or free of complications.

A *simple* procedure is easy to understand and perform, and a *simple* structure is one that is made of basic elements.

Examples:

Monosaccharides are the simplest sugars.

The patient had a simple case of strep throat.

Often associated with negativity, *simplistic* indicates that something is simple to the point of being misleading or oversimplified. A *simplistic* solution does not address the complexities of the problem but rather ignores them.

Example:

To achieve the optimal outcome, we must avoid simplistic solutions.

Describing something as *simplistic* may be viewed as discourteous because of the word's negative connotation. Thus, authors would do well to avoid using *simplistic* when describing other researchers' work or ideas.
