Levonorgestrel Intracervical Systems for Primary Prevention and Treatment of Endometrial Hyperplasia and Endometrial Cancer: A Systematic Review Methodology

Department of Gynecologic Oncology and Reproductive Medicine, The University of Texas MD Anderson Cancer Center

Introduction
Endometrial cancer (EC), ranking fourth among women's cancers in the US, is showing an alarming increase in incidence among younger individuals. The standard of care for EC is a total hysterectomy, bilateral salpingectomy and/or bilateral oophorectomy.

The levonorgestrel-releasing intrauterine system (LNG-IUS) is a popular and effective contraceptive method that releases controlled amounts of levonorgestrel, a type of progesterone, daily into the uterus. Beyond contraception, researchers are studying its non-contraceptive benefits. Evidence indicates that progesterone plays a role in inhibiting uncontrolled estrogen-driven endometrial growth that can increase the risk of developing endometrial hyperplasia, a precursor to most EC, and EC. There is a growing interest in the use of LNG-IUS for endometrial hyperplasia and EC.

Aim
To conduct a detailed methodology for a systematic review of existing research on the preventive and/or control effects of LNG-IUS on endometrial hyperplasia and EC, following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) and PROSPERO guidelines to ensure rigor and transparency.

Methods

Results
A total of 1,168 results were retrieved from the three databases including the original set of 2 key articles supplied by the research team (MEDLINE = 314; Embase = 796; Cochrane Library = 58). The results were uploaded to Covidence for deduplication and eligibility screening. After deduplication, 908 unique publications were identified.

Next Steps
Two independent reviewers will conduct a full-text review and extract relevant data from selected articles. Descriptive statistics will be performed to provide a summary of key characteristics and measures related to the outcomes of interest associated with the prevention and/or control of endometrial hyperplasia and EC by LNG-IUS. Additionally, qualitative interviews will be conducted to assess the feasibility and acceptability of the IUS for our target population.

Conclusions
A comprehensive systematic review, with the assistance of a medical librarian, can be used to identify evidence analyzing the efficacy of LNG-IUS in inhibiting estrogen-driven endometrial growth associated with endometrial hyperplasia and EC.

The limitations of this systematic review include potential heterogeneity among the included studies, the possibility of publication bias, variations in study quality, challenges in data synthesis due to reporting differences, and potential confounding effects of concomitant interventions.

Funding Acknowledgment
• Training grant from the National Cancer Institute (R25CA056452, Dr. Shine Chang, Principal Investigator)
• Cancer Center Support Grant from the National Institutes of Health/NCI under award number P30CA016672
• National Institutes of Health Training Grant (T32 CA101642) - NNA
