Background

- Latinos with cancer are more likely to suffer from psychological morbidities compared to non-Latino white patients.
- Latinos cancer patients report less use of psychological interventions compared to their non-Latino white patients.
- Cancer can also have significant effects on the psychological wellbeing of family caregivers.
- As part of a larger study to adapt a mindfulness-based intervention for Latino cancer patients and their family caregivers, this project:
  - Evaluated aspects of feasibility
  - Explored strategies for coping with cancer

Methods

- Patient-Caregiver dyads were recruited at MD Anderson’s Oncology Program at Lyndon B. Johnson Hospital (LBJ).
- LBJ serves low-income and medically underserved patients.

Inclusion criteria:

- Patients only:
  - Diagnosed with a stage III-IV solid tumor
  - On active treatment
  - Self-identify as Hispanic/Latino
  - ECOG (Eastern Cooperative Oncology Group) performance status of ≤2
  - Willing to participate in the study with a family caregiver

- Patients and caregivers:
  - At least 18 years old
  - Able to speak English or Spanish
  - Have access to the internet

Study Procedures

- Patients and caregivers completed a brief survey over the phone.
- Dyads participated in a 1.5 hour formative research session that included:
  - Semi-structured interviews to explore cancer related experiences
  - Brief mindfulness exercises
  - Their feedback on the mindfulness exercises

Qualitative Data Analysis

- ATLAS.ti was used to identify preliminary themes used to cope with cancer.

Table 1. Categorical responses asked to both patient and caregiver regarding the mindfulness exercises. (n=40)

Preliminary qualitative quotes:

- Religion and support from family/friends were the two predominantly preliminary themes seen to cope with cancer.

  “Yes. Even prayer is a way of connecting and meditating.”

  “The faith we have has helped us; we're a catholic family. I think that mutual support and faith in God, I think that’s what has helped us stand on our feet.”

  “Now, that we've been through this strong problem, all bonds were tightened stronger; a feeling of support, of love, of help, of everything.”

Conclusions

- Data suggests that mindfulness-based practice may be a feasible approach to decrease stress in Latino patients/caregivers.
- Better understanding on the effect of mindfulness-based practice in the Latino community.
- Findings will then be used in a later state to adapt to a larger study of Latino patient-caregiver dyads in Phase 2.
